### SUB-THEME

Opportunities from Wellbeing

### KEYWORDS

mental health, sentiment analysis, web scraping, topic modelling

### CATEGORY

Poster

### ABSTRACT

#### BACKGROUND

In June 2020, Singapore launched mindline.sg, an anonymous digital mental health resource website. As part of its resources, the platform includes *let's talk*, a community forum promoting open mental health discussions and offering resources, education, and support among local students.

#### OBJECTIVES

This poster aims to textually analyse discussions within mindline.sg's *let's talk* forum, focusing on identifying prevalent wellbeing themes through analysing sentiment patterns and topic modelling. By understanding these aspects, this poster hopes to derive insights that will inform strategies for promoting mental wellness and enhancing psychological safety among students.

## METHODS

### Data Collection and Preprocessing

*let's talk* was selected as the primary data source for this poster due to its role as a public forum for mental health discussions among local students.

A total of 1,086 unique forum posts were systematically collected using web scraping techniques with Python, covering the period from June 2022 to June 2024. Specifically, the BeautifulSoup and Selenium libraries were utilised to extract URL links, post titles, and content, ensuring comprehensive coverage of recent discussions up to June 2024.

Pre-processing text normalisation techniques such as lowercasing, stop words removal and tokenisation were applied to standardise the textual data for further analysis.

### Sentiment Analysis

Sentiment analysis was conducted to assess the emotional tone of these forum discussions. The analysis utilised the VADER (Valence Aware Dictionary and Sentiment Reasoner) sentiment analysis tool provided by NLTK (Natural Language Toolkit). The VADER sentiment analyser computed sentiment scores for each post, generating a compound score that reflects overall sentiment polarity (positive, neutral, or negative).

Posts were categorised based on their compound sentiment score:

- Positive: Posts with a compound score  $\geq 0.05$ .
- Negative: Posts with a compound score  $\leq -0.05$ .
- Neutral: Posts with compound scores between  $-0.05$  and  $0.05$

### Topic Modelling

To uncover the primary themes discussed in the forum posts, this poster utilised Latent Dirichlet Allocation (LDA), a widely used probabilistic model in natural language processing. LDA identifies clusters of words that frequently occur together across posts, assuming these clusters represent coherent topics.

## RESULTS

Sentiment analysis (see Figure 1) unveiled a diverse spectrum of emotional tones within forum discussions, encompassing positive, neutral, and negative sentiments. Notably, a significant majority of posts expressed negative sentiments, highlighting prevalent challenges and emotional distress among forum participants.

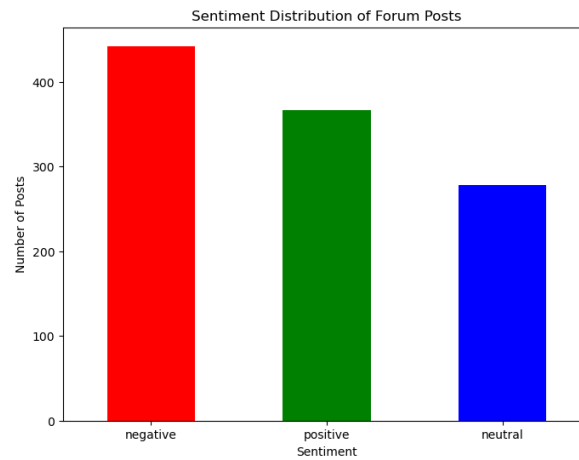

Figure 1. Sentiment Analysis of forum posts

The temporal analysis (see Figure 2) revealed spikes in negative sentiments, particularly in January 2024 (i.e., start of a new school term) and April 2024 (i.e., exam period). These spikes suggest heightened stress and challenges faced by students during these periods, which are critical for informing targeted interventions and support strategies.

Figure 2. Temporal Sentiment Analysis

Using Latent Dirichlet Allocation (LDA), we identified five key themes in forum discussions:

- **Personal Experiences and Emotions:** Topics included discussions about work, social interactions, and daily life.
- **Emotional Expression and Relationships:** Topics centered on feelings of loneliness, social connections, and personal identity.
- **Existential Reflections and Growth:** Discussions focused on life reflections, personal development, and aspirations.
- **Family Dynamics and Personal Challenges:** Themes explored familial relationships, school experiences, and personal responsibilities.
- **Seeking Advice and Support:** Posts often sought advice, support, and shared personal challenges.

## CONCLUSION AND FUTURE DIRECTIONS

This study examined discussions from mindline.sg's *let's talk* forum using sentiment analysis and topic modelling, highlighting prevalent negative sentiments and key thematic clusters among students. Future directions could explore the dynamics and interactions between different users within the forum, leveraging network analysis to understand community support structures and identify influential contributors. These insights could further inform personalised interventions and enhance the efficacy of mental health support initiatives in educational contexts.
